(57) **ABSTRACT**

A frame assembly that includes a frame side, a channel disposed in the frame side and a Teflon guide disposed in the channel, the Teflon guide having a seal feature and a guide feature.

**19 Claims, 7 Drawing Sheets**

FIG. 3

FIG. 4

## 1

TEFLON POCKET SLIDE GATE AND  
METHOD OF ASSEMBLY

## TECHNICAL FIELD

The present disclosure relates generally to air handling equipment, and more specifically to a Teflon pocket slide gate that eliminates the need for placing threaded fasteners in the air stream.

## BACKGROUND OF THE INVENTION

Air handling equipment is used to control the flow of heating, ventilation and air conditioned (HVAC) air in buildings.

## SUMMARY OF THE INVENTION

A frame assembly is disclosed that includes a frame side, a channel disposed in the frame side and a Teflon guide disposed in the channel. The Teflon guide has a seal feature and a guide feature, so as to allow the Teflon guide to be secured in place without the use of threaded fasteners, which could compromise the integrity of the seal.

Other systems, methods, features, and advantages of the present disclosure will be or become apparent to one with skill in the art upon examination of the following drawings and detailed description. It is intended that all such additional systems, methods, features, and advantages be included within this description, be within the scope of the present disclosure, and be protected by the accompanying claims.

BRIEF DESCRIPTION OF THE SEVERAL  
VIEWS OF THE DRAWINGS

Aspects of the disclosure can be better understood with reference to the following drawings. The components in the drawings are not necessarily to scale, emphasis instead being placed upon clearly illustrating the principles of the present disclosure. Moreover, in the drawings, like reference numerals designate corresponding parts throughout the several views, and in which:

FIG. 1 is a diagram of an ambient frame assembly in accordance with an exemplary embodiment of the present disclosure;

FIG. 2 is a diagram of a system frame assembly in accordance with an exemplary embodiment of the present disclosure;

FIG. 3 is a diagram showing a profile of an ambient frame side in accordance with an exemplary embodiment of the present disclosure;

FIG. 4 is a diagram showing a profile of a system frame side in accordance with an exemplary embodiment of the present disclosure;

FIG. 5 is a diagram showing ambient and system end plates in accordance with an exemplary embodiment of the present disclosure;

FIG. 6 is a diagram showing an exploded ambient frame assembly in accordance with an exemplary embodiment of the present disclosure;

FIG. 7 is a diagram showing an exploded system frame assembly in accordance with an exemplary embodiment of the present disclosure; and

FIG. 8 is a diagram of a contoured Teflon guide in accordance with an exemplary embodiment of the present disclosure.

## 2

DETAILED DESCRIPTION OF THE  
INVENTION

In the description that follows, like parts are marked throughout the specification and drawings with the same reference numerals. The drawing figures might not be to scale and certain components can be shown in generalized or schematic form and identified by commercial designations in the interest of clarity and conciseness.

FIG. 1 is a diagram of an ambient frame assembly 100 in accordance with an exemplary embodiment of the present disclosure. Ambient frame assembly 100 and the other metal components and assemblies disclosed herein can be formed from steel, aluminum or other suitable materials, by processing such as extrusion, punching, laser cutting, die cutting or other suitable processes.

Ambient frame assembly 100 includes frame sides 102, which are disposed between front end assembly 108 and rear end assembly 106, which are coupled to frame sides 102 by bolts 114 that are attached to end plates 104 and 112. Rivets, screws, spot welding or other suitable connectors can also or alternatively be used to couple front end assembly 108 and rear end assembly 106 to frame sides 102. End plates 104 and 112 are connected to frame sides 102 by brazing, TIG welding, arc welding or in other suitable manners. Tabs 110 are attached to front end assembly 108 by brazing, TIG welding, arc welding or in other suitable manners.

In operation, ambient frame assembly 100 is disposed in an ambient environment outside of associated ductwork, and houses a blade assembly and driver (not shown), that is used to open and close a duct in a ventilation passage slide gate. Ambient frame assembly 100 is configured to use Teflon guide seals, to help maintain a low-leakage environment for the slide gate.

FIG. 2 is a diagram of a system frame assembly 200 in accordance with an exemplary embodiment of the present disclosure. System frame assembly 200 bolts to ambient frame assembly 100, and provides the frame for a slide gate that is disposed in an HVAC ventilation passageway.

System frame assembly 200 includes frame sides 202, which are disposed between front end assembly 208 and rear frame side 204. Frame sides 202 include a plurality of holes 210, which are used to secure system frame assembly 200 to HVAC ductwork, and which can be formed by punching, drilling or in other suitable manners. Front end assembly 208 is coupled to frame sides 202 by bolts 114 that are attached to end plates 208. Rivets, screws, spot welding or other suitable connectors can also or alternatively be used to couple front end assembly 208 and rear frame side 204 to frame sides 202. End plates 208 are connected to frame sides 202 by TIG welding, arc welding or in other suitable manners. Rear frame side 204 is attached to frame sides 202 by TIG welding, arc welding or in other suitable manners. Front bracket 206 is coupled to frame sides 202 by welding or in other suitable manners, and has holes for connection to HVAC ductwork and additional holes for securing a seal made from stainless steel or other suitable materials to system frame assembly 200.

In operation, system frame assembly 200 is coupled to ambient frame assembly 100 using end plate 208, which is bolted to end plate 104 of ambient frame assembly 100, or in other suitable manners. Seals are disposed in frame sides 202 and rear frame side 204, which help to provide a seal between the inner HVAC duct environment and the external ambient environment.

FIG. 3 is a diagram showing a profile of an ambient frame side 102 in accordance with an exemplary embodiment of

3

the present disclosure. Ambient frame side **102** includes major side section **302** and minor side section **304**, which form the sides of the duct interface that connects to the duct that the assembled slide gate is used with. Major side section **302** is larger than minor side section **304** in order to allow ambient frame assembly **100** to accommodate a blade drive assembly (not shown), which can be used to remotely control the state of the slide gate (i.e. open or closed). Ambient frame side **102** further includes Teflon guide pocket **306**, which is used to hold a Teflon guide assembly (not shown) that is used to allow a blade assembly (not shown) to be placed in an air flow path of an air duct, such as to open or close the air flow path in the HVAC ductwork.

FIG. **4** is a diagram showing a profile of a system frame side **202** in accordance with an exemplary embodiment of the present disclosure. Ambient frame side **202** includes side section **402** and side section **404**, which form the sides of the duct interface that connects to the duct that the assembled slide gate is used with. Unlike ambient frame side **102**, the side sections **402** and **404** of system frame side **202** can be the same size. System frame side **202** further includes Teflon guide pocket **406**, which is used to hold a Teflon guide assembly (not shown) that is used to allow a blade assembly (not shown) to be placed in an air flow path of an air duct, such as to open or close the air flow path.

FIG. **5** is a diagram showing ambient end plates **104** and **112** and system end plates **208** in accordance with an exemplary embodiment of the present disclosure. System end plate **208** includes Teflon channel slot **502**, which is configured to allow a Teflon guide assembly to be inserted into Teflon guide pocket **406** of system frame side **202**. In contrast, blade slot **504** of ambient end plate **104** is configured to allow a blade (not shown) to be inserted into ambient frame assembly **100**, and channel slot **506** of ambient end plate **112** is not required to form an air-tight fit with a Teflon guide (not shown).

FIG. **6** is a diagram showing an exploded ambient frame assembly **100** in accordance with an exemplary embodiment of the present disclosure. Ambient frame assembly **100** includes Teflon guide seals **602**, which are inserted into Teflon guide pocket **306** of ambient frame sides **102**. Blade **604** is then inserted into ambient frame assembly **100**, such as to allow a duct to be selectively opened or closed. In addition, blade **604** has a length greater than the length of Teflon guide seals **602**, so that blade **604** maintains the position of Teflon guide seals **602** in Teflon guide pockets **306** regardless of whether blade **604** is disposed entirely within ambient frame assembly **100** or system frame assembly **200**.

FIG. **7** is a diagram showing an exploded system frame assembly **200** in accordance with an exemplary embodiment of the present disclosure. System frame assembly **200** includes Teflon guide seals **702**, which have dovetailed ends **706** that are inserted into Teflon guide pocket **406** of system frame sides **202**. System frame assembly **200** also includes Teflon guide seal **704**, which includes dovetailed ends **708** that form an airtight seal against dovetailed ends **706** of Teflon guide seals **702**. Blade **704** is then inserted into system frame assembly **200**, such as to allow a duct to be selectively opened or closed. In one exemplary embodiment, blade **704** can be the same as blade **604**.

FIG. **8** is a diagram of a contoured Teflon guide **800** in accordance with an exemplary embodiment of the present disclosure. Contoured Teflon guide **800** includes seal **806**, which forms an air tight seal against Teflon guide pockets **306** and **406** of ambient frame side **102** or system frame side **202**, respectively. Blade slot **804** allows blade **604**, blade

4

**704** or other suitable components to be easily inserted and withdrawn from ambient frame assembly **100**, system frame assembly **200** or other suitable components. Contoured Teflon guide **800** thus helps to prevent blade **604** or blade **704** in a frame assembly (or other suitable components in other suitable assemblies) from becoming stuck or frozen in place, and also provides an air tight seal with ambient frame assembly **100**, system frame assembly **200** or other suitable components that does not require threaded fasteners to be used in an air stream, where such threaded fasteners can leak.

It should be emphasized that the above-described embodiments are merely examples of possible implementations. Many variations and modifications may be made to the above-described embodiments without departing from the principles of the present disclosure. All such modifications and variations are intended to be included herein within the scope of this disclosure and protected by the following claims.

What is claimed is:

1. A frame assembly comprising:

a frame side;

a channel disposed in the frame side;

a Teflon guide disposed in the channel, the Teflon guide having a seal feature and a guide feature; and a front end plate coupled to the frame side, the front end plate having a channel slot with a contour that matches a contour of the channel.

2. The frame assembly of claim 1 further comprising:

a frame rear coupled to the frame side;

a channel disposed in the frame rear; and

a rear Teflon guide disposed in the channel of the frame rear.

3. The frame assembly of claim 2, wherein the Teflon guide and the rear Teflon guide each comprise a dovetail joint.

4. The frame assembly of claim 1 wherein the frame side further comprises a plurality of bolt holes configured to allow the frame side to be connected to ductwork.

5. A frame assembly comprising:

a frame side;

a channel disposed in the frame side;

a Teflon guide disposed in the channel, the Teflon guide having a seal feature and a guide feature; and a front end plate coupled to the frame side, the front end plate having a channel slot with a contour that is larger than a contour of the channel.

6. The frame assembly of claim 5 further comprising a rear end plate coupled to the frame side, the rear end plate having a channel slot with a contour that is smaller than the channel.

7. The frame assembly of claim 5 wherein the frame side further comprises a plurality of bolt holes configured to allow the frame side to be connected to ductwork.

8. A frame assembly comprising:

a first frame side;

a second frame side;

a first channel disposed in the first frame side;

a second channel disposed in the second frame side;

a first Teflon guide disposed in the first channel, the first Teflon guide having a seal feature and a guide feature;

a second Teflon guide disposed in the second channel, the second Teflon guide having a seal feature and a guide feature; and a front end plate coupled to the first frame side and the second frame side, the front end plate having a channel slot with a contour that matches a contour of the first channel and the second channel.

## 5

9. The frame assembly of claim 8 further comprising:  
 a frame rear coupled to the first frame side and the second  
 frame side;  
 a channel disposed in the frame rear; and  
 a rear Teflon guide disposed in the channel of the frame  
 rear.

10. The frame assembly of claim 9, wherein the first  
 Teflon guide, the second Teflon guide and the rear Teflon  
 guide each comprise a dovetail joint.

11. The frame assembly of claim 8 wherein the first frame  
 side and the second frame side further comprise a plurality  
 of bolt holes configured to allow the first frame side to be  
 connected to first ductwork and the second frame side to be  
 connected to second ductwork.

12. A frame assembly comprising:

a first frame side;  
 a second frame side;  
 a first channel disposed in the first frame side;  
 a second channel disposed in the second frame side;  
 a first Teflon guide disposed in the first channel, the first  
 Teflon guide having a seal feature and a guide feature;  
 a second Teflon guide disposed in the second channel, the  
 second Teflon guide having a seal feature and a guide  
 feature; and a front end plate coupled to the first frame  
 side and the second frame side, the front end plate  
 having a channel slot with a contour that is larger than  
 a contour of the first channel and the second channel.

13. The frame assembly of claim 12 further comprising a  
 rear end plate coupled to the first frame side and the second  
 frame side, the rear end plate having a channel slot with a  
 contour that is smaller than the first channel and the second  
 channel.

14. The frame assembly of claim 12 wherein the first  
 frame side and the second frame side further comprise a  
 plurality of bolt holes configured to allow the first frame side  
 to be connected to first ductwork and the second frame side  
 to be connected to second ductwork.

## 6

15. A frame assembly comprising:

a first frame side having a plurality of bolt holes config-  
 ured to allow the first frame side to be connected to first  
 ductwork;

a second frame side having a plurality of bolt holes  
 configured to allow the second frame to be connected  
 to second ductwork;

a channel disposed in the first frame side;

a front end plate coupled to the first frame side, the front  
 end plate having a channel slot;

a Teflon guide disposed in the channel, the Teflon guide  
 having a seal feature and a guide feature; and wherein  
 the channel slot of the front end plate has a contour that  
 is larger than a contour of the channel.

16. The frame assembly of claim 15 further comprising a  
 frame rear coupled to the first frame side.

17. The frame assembly of claim 16 further comprising:

a channel disposed in the frame rear; and  
 a rear Teflon guide disposed in the channel of the frame  
 rear.

18. The frame assembly of claim 16, wherein the Teflon  
 guide and the rear Teflon guide each comprise a dovetail  
 joint.

19. A frame assembly comprising:

a first frame side having a plurality of bolt holes config-  
 ured to allow the first frame side to be connected to first  
 ductwork;

a second frame side having a plurality of bolt holes  
 configured to allow the second frame side to be con-  
 nected to second ductwork;

a channel disposed in the first frame side; a front end plate  
 coupled to the first frame side;

a Teflon guide disposed in the channel, the Teflon guide  
 having a seal feature and a guide feature; and a rear end  
 plate coupled to the frame side, the rear end plate  
 having a channel slot with a contour that is smaller than  
 the channel.
